Type and level of	Type and level of studies: Doctoral Academic, Higher level - III cycle										
Title of the study program: (303) Statistics, Doctoral Academic											
Subject title: Mu	Iltivariate ana	lysis 1-D									
Subject code: DMUA											
Number of ECT	S : 9										
Subject status (Compulsory / Elective): Elective											
Teacher/s (Name, last name): Vladimir, Vasić											
Number of active	Number of active teaching lessons: Other lessons										
Lectures: 3	Practice	Other forms of	Study research work:	0							
	classes: 0	teaching: 0	3								
Prerequisite: nor	ne										
Subject objective	e:										
The main objective	ve of the subj	ect is a multidimensional s	tatistical analysis of the surve	yed data. Because							
many variables ar	re recorded at	the same time over the ob	servation units, this means that	t their							
simultaneous acti	on must also	be included in the analysis	. The multivariate analysis air	ns to show and							
indicate the conne	ection betwee	en variables in a much redu	ced (two or three-dimensional	l) space. In this							
way it is possible	to describe th	he structure or form of con	nection between the variables.	, which would be							
impossible within	the original	dimensional space.									
Subject outcome	e (gained kno	wledge):									
After mastered sk	tills from the	given subject, the acquired	knowledge enables business	application of							
multivariate analy	ysis methods.	Multivariate analysis meth	nods are appropriate for each o	of the following							
business research	tasks: data re	eduction or structural simp	lification; sorting and groupin	g data;							
Investigating the	dependence b	between the recorded varia	bles; prediction; as well as the	construction of							
business hypothes	ses and their t	testing. In the application of	of these analyzes in market res	earch, a large part							
of these techniques belongs to the area of perceptual mapping.											
Subject content/st	tructure: Mu	Itidimensional random var	ables. Conjoint analysis: selec	ting a plan,							
estimating the score statistics, simulation. Classification tree analysis: model creation, model evaluation,											
model enhanceme	model enhancement. Problem solving problem. Nonlinear canonical correlation analysis: marginal										
frequencies, weig	ints, compone	ent load, evaluation, quanti	fication, centroids, object scal	es.							
Correspondence a	Correspondence analysis: normalization, corresponding table, dimensionality, double diagram, profiles										
and spacing, row dots and columns. Multidimensional scaling: selecting the number of dimensions, stress											
descriptive statist	ijustment mea	asures, and final coordinate	s of the common space. Rena	billty analysis:							
descriptive statist	ics, Crondaci	is alpha, split sample coel	ficients, Guttinan lower bound	is, parallel and							
Tooching mathe	striking parallel models										
well as the way in	us: The lecture	tical software is used With	and procedures of multivariate	and research							
well as the way in which statistical software is used. Within the framework of the study and research											
work, solving complex tasks is carried out, with the neip of the applied statistical apparatus, in order for the candidates to understand the given material, which they could later apply in practice. Special attention											
dedicates to solving real cases from business practice, where modeling is done using statistical software											
SPSS											
Grading (maximum number of noints 100)											
Pro-avamination obligations Daints Final avam											
Activities during	lectures		Written evam								
Practice lessons			Oral exam	60							
Colloquium/9				00							
Semester nanors		40
